

2CRSi IS COMMITTED TO TESTING ALL SYSTEMS ASSEMBLED ON ITS PREMISES BEFORE SHIPPING.

Unless explicitly requested, **each system undergoes a «warm-up test»**, also called «bench system», for a minimum period of 12 hours in order to **guarantee the customer performance and stability of the product.**

WHY?

WE ENSURE

The **functionality** of your products

The **durability** of your products

The **performance** of your products

The certification that your products **meet your requirements**

THE BENEFITS

Peace of mind that the systems are **reliable**

No risk of failure upon unpacking

Component firmware and BIOS **updated to the latest version**

HOW?

These tests are carried out using **internal softwares specifically dedicated to this purpose**. They include a processor **warm-up test**, a full **RAM test**, an integrity **test for storage devices**, a **verification of the detected hardware and firmware** versions on each server.

At the customer's request, **a detailed test report** can be written by our team. It will include all relevant information about the systems tested and their proper functioning.

Some servers have specific technical constraints that prevent certain tests from being carried out, such as immersion servers that only undergo limited functional testing to prevent damage to them.

When our servers leave our premises, they are functional, ready to be installed!
